Abstract for an Invited Paper
for the MAR05 Meeting of
the American Physical Society

Cross-coupling of Tetrahedratic Order

HELMUT R. BRAND, Department of Physics, University of Bayreuth, 95440 Bayreuth

We discuss how tetrahedratic order couples to external fields, forces and other variables [1-3]. In particular, we show that the application of an external electric field to a tetrahedratic phase induces quadrupolar orientational order, thus inducing a nematic phase in a field. We discuss a linear gradient term coupling tetrahedratic and quadrupolar order and show that this term could explain the ambidextrous chiral domains observed in nematic phases formed by achiral banana-shaped molecules.
