Measurement of Spin-Correlation Coefficients for p-3He Elastic Scattering

T.V. DANIELS, T. KATABUCHI, T.B. CLEGG, H.J. KARWOWSKI, University of North Carolina at Chapel Hill and Triangle Universities Nuclear Laboratory — As part of an investigation of the A=4 system, we measured the spin-correlation coefficients $A_{yy}$, $A_{oy}$, $A_{yy}$, and $A_{xx}$ for p-3He elastic scattering at $E_{lab}$ of 2.3, 2.7, 4.0, and 5.5 MeV and $\Theta_{lab}$ between 30° and 150°. The data were taken using TUNL’s atomic beam polarized ion source and a new spin-exchange optical pumping polarized 3He target. We aim to resolve ambiguities in the phase shifts of George and Knutson, which seem most sensitive to $A_{xx}$ and $A_{yy}$ at the lowest of these energies. Our 5.5 MeV data compare well with earlier data. Our new measurements will be shown with phase-shift-analysis solutions.
