D Meson Decays into ϕ , η and η' RADIA SIA, Syracuse University, CLEO COLLABORATION — We report on inclusive and exclusive decays of charmed mesons into particles that have a large content of $s\bar{s}$ quarks, namely the ϕ , η and η' . Data taken with the CLEO detector in the energy region where correlated $D\bar{D}$ pairs are produced are used, where one D meson is fully reconstructed and then the properties of the other D are examined. These measurements are particularly useful for ascertaining the properties of B meson decays.
