Measurement of $B \to D^0K^*$ decays with $D^0 \to CP$ eigenstates

QUINCY KWAN-SUT WONG, The Ohio State University, BABAR COLLABORATION — We use 384 million $\Upsilon(4S) \to BB$ events collected with the BaBar detector at the PEP-II $B$ Factory to study the decay $B^- \to D^0K^{*-}$ where the $K^{*+} \to K^0_S\pi^-$ and the $D^0$ decays into $CP$-eigenstates. In particular, we reconstruct the $CP = +1$ final states into $K^+K^-$ and $\pi^+\pi^-$ and the $CP = -1$ final states into $K^0_S\pi^0$, $K^0_S\phi$, and $K^0_S\omega$. We also include the non-$CP$ mode $D^0 \to K^-\pi^+$ in our study.
