The Astrophysical $^{187}\text{Re}^{187}\text{Os}$ Ratio: Measurement of the $^{187}\text{Re}(n, 2n\gamma)^{186m}\text{Re}$ Destruction Cross Section

J.H. KELLEY, NC State U and Triangle Universities Nuclear Laboratory, D.B. MASTERS, Samford U, S. HAMMOND, H.J. KARWOWSKI, UNC-Chapel Hill and TUNL, E. KWAN, A. HUTCHESON, A.P. TONCHEV, W. TORNOW, Duke U and TUNL, F.G. KONDEV, S. ZHU, Argonne National Laboratory — We have initiated a program to measure neutron-induced cross sections on $^{187}\text{Re}$ using monoenergetic neutron beams and an array of HPGe $\gamma$-ray detectors at TUNL. Our emphasis is on measuring transitions in the $^{187}\text{Re}(n, 2n\gamma)$ reaction that populate the long-lived isomeric state, $^{186m}\text{Re}$. These data are needed to decrease uncertainties in the $^{187}\text{Re}/^{187}\text{Os}$ cosmochronometer, which dates the $r$-process nucleosynthesis. Results from a first run using a pulsed 12 MeV neutron beam will be presented, and an overview of planned measurements that will measure the excitation function making use of both prompt $\gamma$-ray detection and activation techniques will be given.
