Pulse Shape Discrimination (PSD) in Liquid Argon BEI CAI, Queen’s University, Canada, THE DEAP-1 COLLABORATION — Dark Matter Experiment using Argon Pulse-shape discrimination (DEAP) plans to search for WIMPs (Weakly Interacting Massive Particles) through elastic scattering on $^{40}$Ar. In this single-phase liquid argon (LAr) experiment discrimination of $\beta$ and $\gamma$ backgrounds from the WIMP-induced nuclear recoil signal is achieved by analyzing the pulse shape of scintillation light. A 7-kg low-background LAr scintillation detector was constructed and run at Queen’s University in Canada. A background rejection of $6 \times 10^{-8}$ at 120-240 photo-electrons was achieved.
