Study of $\overline{B^0}, B^- \to D^{(*)}p\bar{p}\ n\pi$, $n = 0, 1, 2$ decays TAE MIN HONG, UC, Santa Barbara, BABAR COLLABORATION — Using a data sample of about 414fb^{-1} collected with the $BABAR$ detector at the $\Upsilon(4S)$ resonance, consisting of 455×10^6 $B\bar{B}$ pairs, we measure the branching fractions for ten Cabibbo-favored B decays to final states of the form $\overline{B^0}, B^- \to D^{(*)}p\bar{p}\ n\pi$, $n = 0, 1, 2$ and study their decay dynamics.
