An Effective-Field-Theory Analysis of Low-energy Parity Violation in the NN System

ROXANNE SPRINGER, Duke University

At low energies, parity violation in NN scattering (including photons) is described by an effective field theory (EFT) that includes only contact interactions. I will discuss this EFT, and its application to observables that would be zero in the absence of parity violation: longitudinal asymmetries in polarized nucleon-nucleon scattering, and asymmetries arising from polarized $\bar{n}p \rightarrow d\gamma$ and $np \rightarrow d\gamma$.
