**Charge form factors of light nuclei in chiral effective field theory**

MARIA PIARULLI, Old Dominion University, Norfolk, VA — We use potentials and charge operators derived in chiral effective field theory ( $\chi$ EFT) to calculate charge form factors of  $A = 2 - 4$  nuclei up to next-to-next-to-next-to-next-to leading order (N4LO). The sensitivity of the results is studied as function of the cutoff  $\Lambda$  in the chiral potentials and charge operators. We also present results obtained in a hybrid approach using the conventional AV18 potential and the  $\chi$ EFT charge operators. The theoretical results are compared to the experimental data for momentum transfers  $Q$  up to  $(2 - 3) m_\pi$ . Reasonable agreement is obtained between theory and experiment.
