NuMI Beam Flux Studies for MINERvA LEONIDAS ALIAGA SOPLIN, College of William and Mary, MINERVA COLLABORATION — MINERvA is a few-GeV neutrino scattering experiment which is required to understand the neutrino beam flux in order to make absolute cross section measurements. We have three techniques for constraining the flux: in situ measurements, external hadron production data and muon monitors. In this presentation I will discuss the details and our progress on these efforts.
