Abstract for an Invited Paper
for the APR12 Meeting of
The American Physical Society

What can we learn about 3-body forces from electromagnetic transition rates?

C.J. (KIM) LISTER, University of Massachusetts, Lowell and Argonne National Laboratory

Electromagnetic transition matrix elements have emerged as surprisingly sensitive probes of the influence of three-body forces in nuclei. Recent advances in experimental techniques have made it possible to measure these matrix elements with sufficiently high precision that they can differentiate between three-body formulations. Results from Gammasphere and the Yale array on the isobar triplet ^{10}C, ^{10}B and ^{10}Be will be presented, together with new Variational and Greens Function Monte Carlo calculations.
