

Abstract Submitted  
for the APR15 Meeting of  
The American Physical Society

**Dark matter possibilities** ORVIN WAGNER, Wagner Research Laboratory — In my research I observe signals that penetrate dense matter and I hypothesize that they are due to waves in dark matter. Since they readily penetrate thick matter I hypothesize that they are due to small dark matter particles instead of the usual hypothesized Wimps. For example I observed signals that penetrate my local hill at near 77 m/s. In addition the solar cycle appears to be due to dark matter oscillating in the sun producing standing waves that have to do with planet placement and stability of the solar system. Dozens of experiments, over the past 20 years, confirm the penetrating waves. Examples of the experiments are presented on my website [darkmatterwaves.com](http://darkmatterwaves.com) and US patent number 8,669,917 B1.
