Abstract for an Invited Paper for the APR15 Meeting of the American Physical Society

Experimental Results on Neutrino Scattering

KEVIN MCFARLAND, University of Rochester

High intensity beams and new detectors are enabling us to gather new information about reactions of GeV neutrinos on nuclei, at the transition between elastic and inelastic scattering. Accurate modeling of these complex reactions will benefit greatly from this data. I will review results and capabilities of current and near future experiments, and will discuss how this data can help to sharpen the emerging picture of neutrino interactions.
