**Quantum elements of time and space** DENNIS MARKS, Valdosta State University — Space-times of any number of spaces and times can be generated as tensor products of a time-like unit vector  $\mathbf{T}$  and a space-like unit vector  $\mathbf{S}$ .  $\mathbf{T}$  is a  $2 \times 2$  real anti-symmetric, hence trace-free, matrix squaring to  $-\mathbf{I}$ ;  $\mathbf{S}$  is a  $2 \times 2$  real symmetric trace-free matrix squaring to  $+\mathbf{I}$ .  $\mathbf{T}$  is unique up to sign, corresponding to particles and antiparticles.  $\mathbf{S}$  is a qubit whose eigenvalues are the bits  $+1$  and  $-1$ . Thus the quantization of space is rotationally invariant in  $2d$  and Lorentz invariant in  $4d$ . Use  $\mathbf{S}$  instead of complex numbers  $\mathbf{C}$  to geometrize quantum mechanics. The simplest space-time is the Minkowskian plane with vectors  $\mathbf{T}$  and  $\mathbf{S}$ , which generate a geometric algebra  $\{\mathbf{I}, \mathbf{T}, \mathbf{S}, \mathbf{ST}\}$ , where the bivector  $\mathbf{ST}$  is space-like. It can be used as vector  $\mathbf{X}$  for the Euclidean plane, along with  $\mathbf{Y}=\mathbf{S}$ . They generate a geometric algebra  $\{\mathbf{I}, \mathbf{X}, \mathbf{Y}, \mathbf{YX}\}$ . The bivector  $\mathbf{YX}$  is  $\mathbf{T}$ . The Minkowskian plane and the Euclidean plane have different geometries but the same geometric algebra, which is thus the foundation of both general relativity and quantum mechanics.
