Abstract for an Invited Paper
for the APR17 Meeting of
the American Physical Society

The axion dark matter search at CAPP: a comprehensive approach.

YANNIS SEMERTZIDIS , KAIST/IBS

Axions are the result of a dynamic field, similar to Higgs field, invented to solve the so-called Strong CP-problem, i.e., why the electric dipole moment (EDM) of the neutron and proton has not been observed so far even though the theory of QCD predicts values by about ten order of magnitude larger than current experimental limits. Axions as dark matter can be thought of as an oscillatory field interacting extremely weakly with normal matter. The oscillation frequency is unknown, it can be anywhere between f = 200MHz to 200GHz and it's expected to be at a very narrow line, about df/f =10ˆ-6. A strong magnetic field can be used to convert part of that field into a very weak electric field oscillating at the same frequency and phase as the axion field. In the coming years we plan to develop our experimental sensitivity to either observe or refute the axions as a viable dark matter candidate in a wide axion mass range. That approach includes the development of ultra strong magnets, high quality resonators in the presence of strong B-fields, new resonator geometries, low noise cryo-amplifiers and new techniques of detecting axions. Another related subject, through the strong CP-problem, is the search for the EDM of the proton, improving the present sensitivity on hadronic EDMs by more than three orders of magnitude to better than 10ˆ{-29}e-cm. Usually the study of EDM involves the application of strong electric fields and originally neutral systems were thought to be easier to work with. Recently it became clear that charged particles in all-electric storage rings can be used for sensitive EDM searches by using techniques similar to the muon g-2 experiment. The high sensitivity study of the proton EDM is possible due to the high intensity polarized proton beams readily available today, making possible to reach 10^3 TeV in New Physics scale.
