for the APR17 Meeting of
the American Physical Society

Joining Forces against the Dark Universe: New Results from Spectroscopic Surveys
SHIRLEY HO, Lawrence Berkeley National Lab/ UC Berkeley

Despite tremendous recent progress, gaps remain in our knowledge of our understanding of the Universe. We have not yet pinned down the properties of dark energy, nor have we confirmed Einstein’s theory of Gravity at the largest scales. Current and upcoming large sky surveys of Large Scale Structure (LSS) in galaxies, quasars and Lyman-alpha forest present us with the best opportunity to understand—properties of the Universe. I will first review recent cosmology results from Large Scale Structure, concentrating on BOSS and preliminary eBOSS results using Baryon Acoustic Oscillations and Redshift Space Distortions. I will then introduce novel cosmological probes which combine Cosmic Microwave Background with LSS directly. These novel probes will open new windows into the momentum field of the Universe and Gravity at the largest scales. I will finally put these into the context of upcoming surveys such as Dark Energy Spectroscopic Instrument (DESI), Wide Field Infrared Survey Telescope (WFIRST) and CMB S4.
