Measurement of Neutron Polarization and Transmission for the nEDM@SNS Experiment.[1] KAVISH IMAM, University of Tennessee, NEDM@SNS COLLABORATION — The neutron electric dipole moment experiment at the Spallation Neutron Source (nEDM@SNS) will implement a novel method, which utilizes polarized ultra-cold neutrons (UCN) and polarized ^{3}He in a bath of superfluid ^{4}He, to place a new limit on the nEDM down to 2-310^{28} ecm. The experiment will employ a cryogenic magnet and magnetic shielding package to provide the required magnetic field environment to achieve the proposed sensitivity. This talk will describe the design and implementation of ^{3}He polarimetry setup at the SNS to measure the neutron polarization and transmission losses resulting from passage through the magnetic shielding and cryogenic windows.
