Abstract Submitted for the APR21 Meeting of The American Physical Society

Feasibility studies of neutrino-jet and hadron-in-jet azimuthal modulations in charged-current DIS at the EIC¹ SEBOUH PAUL, University of California, Riverside — We explore the potential of charged-current measurements at the Electron-Ion Collider to gain flavor sensitivity for the 3D imaging of the nucleon. In particular, we focus on the prospects of neutrino-jet azimuthal correlations, which probe the Sivers effect, and hadron-in-jet measurements, which probe the Collins effect and quark transversity. We project the kinematic reach and precision of these measurements and study their feasibility using parameterized detector simulations with the Delphes program.

¹We acknowledge support through DOE Contract No. DE-AC05-06OR23177 under which Jefferson Science Associates, LLC operates the Thomas Jefferson National Accelerator Facility and was also supported by the University of California, Office of the President.
