Ortho- and Para-Positronium Formation Measurements for Positron Scattering by $N_2$ and CO$^*$

ERIK MILLER, DAO DUONG, JESSICA EDWARDS, WALTER KAUPPILA, TALBERT STEIN, EUGENE SURDUTOVICH, Wayne State University — We are investigating ortho- and para-positronium formation for positrons interacting with $N_2$ and CO in a gas scattering cell. These measurements involve the detection of two gamma rays in coincidence for energy windows (1) centered at 511 keV resulting from the decay of short-lived (0.1 ns) para-Ps and the destruction of longer-lived (0.1 ms) ortho-Ps at the scattering cell walls, and (2) from 300 to 460 keV resulting from the three gamma decay of ortho-Ps.\(^1\) By comparing our $3\gamma/2\gamma$ ratios to those for other target gases\(^1\) we find a strikingly anomalous behavior at the Ps formation threshold for $N_2$ where there is an unexpected enhancement of the $2\gamma$ signal compared to the $3\gamma$ signal, while for CO (isoelectronic with N2) the behavior is consistent with the other gases. The anomalous behavior for $N_2$ is consistent with an enhancement of annihilation at the threshold, which is as if Ps is forming and remaining bound to the $N_2^+$ ion until annihilation occurs.
