Coupled-channel pseudo-potential description of Feshbach resonance in two dimensions

KRITTIKA KANJILAL, DOERTE BLUME, Department of Physics and Astronomy, Washington State University, Pullman, WA 99164

We derive pseudo-potentials that describe the scattering between two particles in two spatial dimensions for any partial wave \( m \), whose scattering strength is parameterized in terms of the phase shift \( \delta_m \). Using our \( m = 0 \) pseudo-potential, we develop a coupled channel model with 2D zero-range interactions, which describes the two-body physics across a Feshbach resonance. Our model predicts the scattering length, the binding energy and the “closed channel molecular fraction” of two particles; these observables can be measured in experiments on ultracold quasi-2D atomic Bose and Fermi gases with present-day technology.
