Cavity QED with trapped neutral atoms MICHAEL GIBBONS, CHUNG-YU SHIH, Georgia Institute of Technology, SOO KIM, MICHAEL CHAPMAN, Georgia Institute of Technology — Cavity QED systems consisting of neutral atoms coupled to high-finesse optical micro-cavities have important applications to quantum information processing. We have developed an experiment with trapped atoms in a high finesse cavity in the strong coupling regime. We have demonstrated loading and storage of individual atoms delivered from a magneto-optic trap to the resonator using two parallel atom conveyors. We will discuss the current progress towards implementing atom-atom entanglement within the cavity, as well as future applications.
