Search for the electric dipole moment of the electron with ThO

YULIA V. GUREVICH, Harvard University, WESLEY C. CAMPBELL, University of Maryland, DAVID DEMILLE, Yale University, JOHN M. DOYLE, GERALD GABRIELSE, NICHOLAS HUTZLER, MAXWELL PARSONS, BENJAMIN SPAUN, Harvard University, AMAR C. VUTHA, Yale University, ACME COLLABORATION — The thorium monoxide (ThO) molecule in its metastable H state has been identified as a promising system for measuring the permanent electric dipole moment of the electron (eEDM). We have begun an experiment to measure the eEDM using a high flux, cryogenic beam of ThO. We report our progress, including the production of cold ThO beams with an observed flux of 2×10^9 molecules per ablation shot. We also demonstrate optical pumping of molecules into the H state, which allows us to make a more accurate determination of the H state lifetime.
