Optical bistability in cold atom cavity systems

PRASANNA VENKATESH BALASUBRAMANIAN, DUNCAN O’DELL, McMaster University, JONAS LARSON, NORDITA — Coupled cold atom-cavity/BEC-cavity systems have attracted significant attention owing to their appeal as optomechanical systems [1] and as probes of atomic many body quantum effects in a novel setting [2]. We investigate the non-linear nature of the effective Hamiltonian that describes the cavity-atom system. We analyse the energy dispersion derived from the effective Hamiltonian in regions where the atom-cavity system exhibits bistability.
