Towards room temperature magnetic sensing of a single electron spin in biological systems

NICHOLAS CHISHOLM, PETER MAURER\textsuperscript{1}, GEORG KUCSKO\textsuperscript{2}, PEGGY LO\textsuperscript{3}, NORMAN YAO, BRENDAN SHIELDS, HONGKUN PARK, MIKHAIL LUKIN, Harvard University — We report on recent progress of room temperature sensing for biological applications using nitrogen-vacancy (NV) centers in diamond. First, we discuss progress made toward measuring the magnetic field of a single electron spin using as a sensor the electron spin of an NV in bulk diamond. This is approached by attaching commercially available nitroxide spin labels to the functionalized surface of the bulk diamond, and using a nearby NV center as a sensor. In addition, we present progress toward the study of functionalized nanodiamonds in living cells used as single spin label probes of local magnetic field environments. The ability to sense magnetic fields with submicrometer resolution with sensitivity capable of detecting a single electron spin is of major importance to the biological sciences.
