Adiabatic Preparation of Strongly Correlated Many-body States¹

CHRISTOPHER OLUND, SNIR GAZIT, Univ of California - Berkeley, JOHN MC-GREEVY, Univ of California - San Diego, NORMAN YAO, Univ of California - Berkeley — We present a novel algorithm for adiabatic preparation of strongly correlated many-body states. Our approach is based upon the so-called s-source framework, which constructs a quantum circuit that interpolates between the ground state of system size L and $2L$. This procedure can then be iterated to reach the thermodynamic limit. In contrast with standard algorithms which rely on the variational principle, our approach is based on the adiabatic theorem and may prove particularly useful for Hamiltonians where variational methods tend to fail. We propose an explicit numerical scheme for optimizing the interpolating quantum circuit and benchmark it against DMRG for several spin chain models; even near a quantum phase transition, where the spectral gap is small, we observe good agreement between the methods. The algorithm also has a clear physical interpretation, providing a blueprint to physically prepare large-scale many-body states from smaller systems via a series of local unitaries.
