The American Physical Society

**Flexible fibers in turbulent flows**<sup>1</sup> GAUTIER VERHILLE, IRPHE - UMR 7342, CHRISTOPHE BROUZET, Laboratoire de Physique de l'ENS Lyon, PATRICE LE GAL, IRPHE - UMR 7342, IRPHE TEAM — We describe, for the first time, an experiment devoted to the study of the spatial conformation of a flexible fiber in a turbulent flow. We propose a model for the transition from rigid to flexible regimes as the intensity of turbulence is increased or the elastic energy of the fiber is decreased. This transition occurs for a fiber typical length which is observed experimentally and recovered by our analysis. We also demonstrate that the conformations of flexible fibers in a turbulent flow are analog to conformations of flexible polymers in a good solvent. This last result opens some new and creative ways to model flexible fiber distortions in turbulent flows while addressing fundamental problems in polymer dynamics.
