Self-similar behavior of non-planar non-circular gravity currents

THOMAS BONOMETTI, Institut de Mécanique des Fluides de Toulouse, NADIM ZGHEIB, S. BALACHANDAR, University of Florida — This work reports some new aspects of non-planar non-circular gravity currents obtained from laboratory experiments, fully resolved simulations and box models. We show that these currents eventually reach a self-similar regime during which the local front propagation scales as the square root of time as in circular releases. In particular, the front has a self-similar shape that primarily depends on the aspect ratio of the initial release. The extended box model recently reported in [Zgheib *et al.* 2014 *Theor. Comput. Fluid Dyn.* **28**, 521-529] is used to propose a relation for the self-similar horizontal aspect ratio of the propagating front as a function of the initial horizontal aspect ratio. The experimental and numerical results are in good agreement with the proposed relation.
