Prediction of Algebraic Instabilities

PAULA ZARETZKY, KRISTINA KING, NICOLE HILL, KIMBER-LEE KEITHLEY, NATHANIEL BARLOW, STEVEN WEINSTEIN, MICHAEL CROMER, RIT — A widely unexplored type of hydrodynamic instability is examined - large-time algebraic growth. Such growth occurs on the threshold of (exponentially) neutral stability. A new methodology is provided for predicting the algebraic growth rate of an initial disturbance, when applied to the governing differential equation (or dispersion relation) describing wave propagation in dispersive media. Several types of algebraic instabilities are explored in the context of both linear and nonlinear waves.
