**Qualitative Benchmarking of a Developmental CFD-DEM Code<sup>1</sup>**

WILLIAM FULLMER<sup>2</sup>, JORDAN MUSSER, National Energy Technology Laboratory, ANN ALMGREN, MICHELE ROSSO, OSCAR ANTEPARA, ROBERTO PORCU, JOHANNES BLASCHKE, Lawrence Berkeley National Laboratory — MFiX-Exa is a new code being developed by the National Energy Technology Laboratory and Lawrence Berkeley National Laboratory as part of the U.S. Department of Energy's Exascale Computing Project. MFiX-Exa originated by combining the discrete element method (DEM) modules of the classic MFiX code ([mfix.netl.doe.gov](http://mfix.netl.doe.gov)) with a modern low Mach number projection method for the continuous fluid phase. The new algorithm is implemented using the AMReX software framework for massively parallel block-structured applications ([amrex-codes.github.io](http://amrex-codes.github.io)). This work utilizes a set of qualitative benchmarks which emphasize the phenomenology of a given problem rather than averaged statistical measures typically used in fluid-particle validation studies. The following cases are considered: 1) clustering of inelastic particles in the gas-solid homogeneous cooling system, 2) granular RayleighTaylor instability of particles draining into a gas, 3) rapid injection of a single bubble into a particle bed at incipient fluidization, 4) ordered left-right bubbling pattern of a periodically fluidized bed, 5) segregation of "Brazil nuts" to the top of a small bed, 6) axial banding (segregation) of bi-disperse rotating tumbler. A range of agreement with the expected phenomena is observed and reported.

<sup>1</sup>This research was supported by the Exascale Computing Project (17-SC-20-SC), a collaborative effort of the U.S. Department of Energy Office of Science and the National Nuclear Security Administration.
