

Abstract Submitted  
for the DNP06 Meeting of  
The American Physical Society

**$^{18}\text{F}(\alpha, \text{p})^{21}\text{Ne}$  reaction study for astrophysical implications** HYE  
YOUNG LEE, M. COUDER, University of Notre Dame, A. COUTURE, Los  
Alamos National Laboratory, J. GOERRES, E. STECH, E. STRANDBERG,  
W. TAN, M. WIESCHER, University of Notre Dame, H.-W. BECKER, Ruhr-  
Universitat Bochum, Germany, C. ANGULO, E. CASAREJOS, P. LELEUX, Uni-  
versite Catholique de Louvain, Belgium, D. GROOMBRIDGE, B. FULTON, A.  
LAIRD, University of York, UK, M. ALIOTTA, University of Edinburgh, UK — As  
an alternative neutron source for the weak r-process, one of models suggested the  
r-process nucleosynthesis in the supernova shock passing through the He-rich shell of  
the pre-supernova star. In this helium rich environment, a possible neutron source for  
the second r-process would be the reaction sequence  $^{14}\text{N}(\alpha, \gamma)^{18}\text{F}(\alpha, \text{p})^{21}\text{Ne}(\alpha, \text{n})^{24}\text{Mg}$   
with rapid depletion of  $^{14}\text{N}$ . The  $(\alpha, \text{p})$  reaction on  $^{18}\text{F}$  will be faster than  $\beta^+$  de-  
cay at the high densities and temperature in the shock. The  $^{18}\text{F}(\alpha, \text{p})^{21}\text{Ne}$  reaction  
and the inverse reaction  $^{21}\text{Ne}(\text{p}, \alpha)^{18}\text{F}$  have been measured in the energy range of  
the Gamow window. Experimental results will be presented and compared with  
Hauser-Feshbach calculations and the interests in nuclear physics. The astrophysi-  
cal implications of the new reaction rates will be discussed.
