Technology for Next Generation Dark-Matter Axion Searches\textsuperscript{1}

DARIN KINION, S.J. ASZTALOS, G. CAROSI, C. HAGMANN, L.J. ROSENBERG, K. VAN BIBBER, Lawrence Livermore National Laboratory, L.D. DUFFY, P. SIKIVIE, D.B. TANNER, University of Florida, R. BRADLEY, NRAO, ADMX COLLABORATION — The ADMX Collaboration has set limits on the axion-to-photon coupling for axion mass between 1.9 and 3.3 $\mu$eV, assuming both that axions dominate the local halo density and are ‘hadronic’ or KSVZ axions. A definitive search should relax both constraints, i.e. be sensitive to DFSZ model axions comprising a fraction of the local halo density. We will show that such a search could be realized using near-quantum-limited microwave amplifiers based on dc SQUIDs. The first phase of this upgrade is currently underway.
