Abstract Submitted for the DNP10 Meeting of The American Physical Society

Three-flavor collective oscillations of supernova neutrinos ALEXANDER FRIEDLAND, LANL — Coherent forward scattering of neutrinos off each other leads to complex collective neutrino oscillations inside a supernova. We explore this phenomenon during the cooling stage of the explosion. Two- and three-flavor calculations of the oscillations are shown to give strikingly different results, especially for the inverted mass hierarchy. Analysis shows that the 2-flavor evolution trajectory can be unstable in the 3-flavor space. Additionally, the 3-flavor evolution is shown to be partially non-adiabatic, resulting in a "mixed" spectrum. Our results could impact the interpretation of the future galactic supernova signal, the analysis of the r-process nucleosynthesis, and the predictions of the diffuse supernova neutrino background. Based on Phys. Rev. Lett. 104:191102 (2010).
