

Abstract Submitted  
for the DNP13 Meeting of  
The American Physical Society

**First JAM results on the determination of polarized parton distributions** PEDRO JIMENEZ-DELGADO, Jefferson Lab, JAM COLLABORATION — The Jefferson Lab Angular Momentum (JAM) collaboration is a new initiative aimed at the study of the angular-momentum-dependent structure of the nucleon. First results on the determination of spin-dependent parton distribution functions from world data on polarized deep-inelastic scattering will be presented and compared with previous determinations from other groups. Different aspects of global QCD analysis will be discussed, including effects due to the nuclear structure of deuteron and Helium targets, target-mass corrections and higher twist contributions to the  $g_1$  structure function as well as the  $g_2$  structure function.
