Pair-Symmetric Background of the Spin Asymmetries of the Nucleon Experiment LUWANI NDUKUM, Mississippi State University — The Spin Asymmetries of the Nucleon Experiment (SANE) at the Thomas Jefferson Lab National Accelerator Facility measured inclusive double spin asymmetries by scattering longitudinally polarized electrons on a longitudinally and transversely polarized NH₃ target. The measurements were done at momentum transfer of $2.5 \leq Q^2 \leq 6.5 \text{ GeV}^2$ and Bjorken x of $0.3 \leq x \leq 0.8$. Data were also taken at $0.2 < x < 0.3$. Analysis of the pair-symmetric background used to extract asymmetries from this low x data will be discussed.
