New analysis of levels in $^{147}$La

W.J. LEWIS, Furman University, E.H. WANG, C.J. ZACHARY, J.H. HAMILTON, A.V. RAMAYYA, Y.X. LUO, Vanderbilt University, J.O. RASMUSSEN, LBNL, S.J. ZHU, Tsinghua University, VANDERBILT UNIVERSITY COLLABORATION — Analysis of $\gamma-\gamma-\gamma$ and $\gamma-\gamma-\gamma-\gamma$ coincidence data from the spontaneous fission of $^{252}$Cf has been performed to identify new levels in $^{147}$La. These data were taken with Gammasphere at Lawrence-Berkeley National Laboratory. Twenty-two new transitions and fourteen new levels are established including a spin $39/2^+$ state and spin $47/2^-$ state. $^{147}$La lies very close to the center for octupole deformation; strong $E1$ transitions are observed connecting two opposite parity doublets validating this expected octupole deformation. Additionally, back bending in the moment of inertia plot is observed in one band.

1This work was performed while W.Lewis was a Research Experience for Undergradautes participant at Vanderbilt University.
