Leptophobic Boson Searches

JOHN HARDIN, CRISTIANO FANELLI, MICHAEL WILLIAMS, Massachusetts Inst of Tech-MIT, GLUEX COLLABORATION — The GlueX data set has the potential to improve the sensitivity to leptophobic bosons, including the so called B boson which couples to baryon number, by a factor of $O(100)$ between 450 and 900MeV. We present the expected reach of the limits on the coupling of $\gamma p^- \rightarrow p B$ from the data already taken in Spring 2016 and of the full data set. These results will also set limits on other dark sector models and motivate $e p^- \rightarrow p B$ searches at CLAS.
