

Abstract Submitted
for the DNP17 Meeting of
The American Physical Society

Level structure of Ge-74¹ WILLIAM B WALTERS, A. M. FORNEY, A. D. AYANGEAKAA, University of Maryland, J. SETHI, J. HARKER, C. J. CHIARA, University of Maryland/ANL, R. V. F. JANSSENS, B. P. KAY, S. ZHU, Argonne National Laboratory — The current data for the level structure of Ge-74 from many sources will be presented and supplemented by new data from multi-nucleon transfer reactions using a wide range of beam and target combinations with Gammasphere. Data will be presented to support a spin and parity assignment of 5^- for the level at 2935.5 keV. Transitions between members of the proposed gamma band and negative-parity levels will be shown and both kinds of structures discussed in the context of the triaxiality described by Ragnarsson, Nilsson and Sheline. Interpretations for the structure of the adjacent nuclei, Ge-72 and Ge-76 have been reported by Ayangeakaa et al., and Toh et al., respectively.

I. Ragnarsson, S. G. Nilsson, and R. K. Sheline, *Physics Reports* **45**, 1 (1978).

A. D. Ayangeakaa et al., *Phys. Lett. B* **754**, 254 (2016).

Y. Toh et al., *Phys. Rev. C* **87**, 041304 (2013).

This work is supported by the U.S. Department of Energy, Office of Nuclear Physics under Contract DE-AC02-06CH11357 and under Grant DE-FG02-94ER40834.

¹This research used resources of ANLs ATLAS facility, which is a DOE Office of Science User Facility.
