

Abstract Submitted  
for the DPP06 Meeting of  
The American Physical Society

**Measurement of ion temperature and flow velocity by using LIF and electric probe methods in K2H and DiPS propulsion simulators<sup>1</sup>**  
GEUN-SIG CHOI, KYU-SUN CHUNG, HYUN-JONG WOO, YOUNG JUN SEO, MYOUNG-JAE LEE, Electric Probe Applications Laboratory (ePAL), Hanyang University, TAIHYEOP LHO, YONG HO JUNG, BONG JU LEE, National Fusion Research Center (NFRC) — Ion temperature, plasma flow velocity and plasma density are measured in DiPS (Diversified Plasma Simulator) and K2H (KBSI-KAIST-Hanyang University) propulsion simulators by a laser induced fluorescence (LIF) method and a fast scanning electric probe system, which consists of an rf-compensated single probe and a Mach probe. In both devices helicon plasmas were stably generated with  $m=+1$  right-helical antenna at 13.56 MHz with powers of 1 - 3kW (DiPS) and 0.5 - 1kW (K2H), and open ended magnetic configurations are utilized. The measured plasma parameters are as follows: plasma densities of  $10^{11} - 10^{13} \text{ cm}^{-3}$  (K2H) and  $10^{12} - 10^{13} \text{ cm}^{-3}$  (DiPS), electron temperatures of 3 - 9 eV (K2H) and 2 - 4 eV (DiPS), ion temperatures of 0.14 - 0.17 eV (K2H) and 0.05 - 0.2 eV (DiPS) and drift velocities of 0.8 - 1.6 km/s (K2H) and 0.2 - 0.5 km/s (DiPS).
