Divertor Target Plate Measurements With the New DIII-D Langmuir Probe Array

J.G. WATKINS, SNL, D.A. TAUSSIG, R.L. BOIVIN, T.E. EVANS, T.W. PETRIE, M.A. MAHDAVI, GA, A. NELSON, U. St. Thomas, I. JOSEPH, R.A. MOYER, UCSD, C.J. LASNIER, M.E. FENSTERMACHER, M. GROTH, LLNL — A new Langmuir probe array with higher power handling capability was installed in the DIII-D lower divertor. The new pyrolytic graphite probes have 100X larger mass than the previous design that increases the total energy capacity for longer plasma pulses, a fixed 12.5 degree surface angle for more uniform heat flux, and a symmetric “rooftop” design to allow operation with reversed toroidal field. The 4 mm wide probes are located 1.5 cm apart near the pumping baffle entrance for improved spatial resolution and 3 cm apart on the shelf above the pump. Target plate profiles, of $n_e$, $T_e$, and $I_{sat}$ at high spatial resolution during radiative divertor and ELM suppression experiments, which use strong divertor pumping, will be shown.
