Possible mechanisms for dust grain acceleration in plasmas¹

PADMA KANT SHUKLA, LENNART STENFLO, BENGT ELIASSON, Department of Physics, Umea University, SE-90187 Umea, Sweden — There exists conclusive evidence of charged dust grain acceleration in tokamak edges as well as in cosmic plasmas. Our objective here is to present an evaluative description of dust particle acceleration in magnetized dusty plasmas. Possible acceleration mechanisms involve ion drag force caused by plasma flow as well as strong ambipolar electric fields created by the ponderomotive force of large amplitude waves in magnetoplasmas. Spatio-temporal scales over which the dust grain acceleration occurs are discussed.
