Experiments and ELM-Suppression in Double-Null DIII-D Plasmas¹ E.A. LAZARUS, Oak Ridge National Laboratory, T.E. EVANS, General Atomics, M.E. FENSTERMACHER, Lawrence Livermore National Laboratory — Experiments are underway on DIII-D to obtain ELM-suppression via resonant magnetic perturbations [1] in double-null (stellarator symmetric) configurations. While density pumpout was observed in these initial experiments, ELM suppression was not obtained. A previous attempt was unsuccessful. In this attempt we will investigate whether the difference in connection length between single and double null plays a critical role by varying the magnetic balance around a double-null configuration. Experimental results will be reported.
