

Abstract Submitted  
for the DPP13 Meeting of  
The American Physical Society

**Historical time-recessive recombinant nucleotidal gene transfer**

MICHAEL A. NORTON, Student — Whether conscious of it or not, physicist Tim Berners-Lee basically applied principle of a nuclear chain reaction to electron transport, a remarkable outcome being the world wide web. On a less dense exponential than the nucleus, but still by out of control design (1999), the flow of electrons with high symmetry (hypertext) brought about astonishing new insights to the field. No one in the author's sphere of influence, including the author, ever learned or taught that such chain reactions have a time-recessive trajectory, such that key significant moments in the new science had impact not only the world at present, but on scale overlapping with ancestors. Dr. Chuck Darwin learned man indeed did arise in Africa (brown toastmasters); author suggests his creed "survival of the fittest" in post-20th century hindsight, for man initialized nuclear energy in Eurasia (white toastmasters), and nearly brought the world to collapse by dropping nuclear weapons on humans in Asia (yellow toastmasters), be best updated "survival of the most communicative." If true, this informs that the measure of the appended science's power is as equally as important as the measure of its speed,; ergo, there really is no energy crisis.
