**Combined Current Profile and  $\beta_N$  Control to Facilitate Accessibility and Reproducibility Testing of High- $q_{min}$  Steady-State Scenarios<sup>1</sup>**

W. WEHNER, J.M. BARTON, M.E. LAURET, E. SCHUSTER, U. Lehigh, C.T. HOLCOMB, B. VICTOR, LLNL, J.R. FERRON, T.C. LUCE, R. LA HAYE, GA, F. TURCO, Columbia U., W. SOLOMON, PPPL — The capability of combined current profile and  $\beta_N$  control to enable access and repeatability of steady-state scenarios for high  $q_{min} > 1.5$  discharges is studied in both nonlinear simulations and experiments. The presentation focuses on model-predicted  $q$ -profile+ $\beta_N$  control, which numerically solves successive optimal control problems over a receding time horizon by exploiting efficiently solvable quadratic programming techniques. One of the key advantages of this control approach is that it allows for explicit incorporation of state/input constraints to prevent the controller from driving the plasma outside of stability/performance limits and obtain, as closely as possible, steady state conditions in the  $q$  profile. To characterize the  $q$  profile+ $\beta_N$  response, empirical correlations are combined with first-principles laws to arrive at a control-oriented model, which captures the dominant physics that is necessary for model-based optimal control design.
