NMR in New BiS$_2$-Layered Superconductor LaO$_{0.5}$F$_{0.5}$BiS$_2$\(^1\)

SHRISHTI YADAV, OSCAR BERNAL, California State University, Los Angeles,
LEI SHU, JIAN ZHANG, Fudan University Shanghai — A new BiS$_2$-layered compound, LaO$_{0.5}$F$_{0.5}$BiS$_2$, was recently discovered to be a superconducting material ($T_c \sim 3$ K, ambient pressure and $\sim 10$ K, 2 GPa). We are conducting a Nuclear Magnetic Resonance study of LaO$_{0.5}$F$_{0.5}$BiS$_2$ to shed light on its superconducting properties as functions of temperature and magnetic field. Our study emphasizes the NMR of $^{19}$F nuclei between the temperatures of 15 K to 2 K. We present spectral parameters and spin-spin $T_2$ relaxation time data which occur above and below the superconducting state. Our data indicate changes of behavior below $T = 10$ K in a sample for which $T_c \sim 3$ K.
