Excitation of the $3p^55p$ levels of Argon from the $3p^54s$ metastable levels\(^1\) RAJESH SRIVASTAVA, LALITA SHARMA, Physics Department, Indian Institute of Technology Roorkee, Roorkee 247667, India, ALLAN STAUFFER, Department of Physics and Astronomy, York University, Toronto, Canada M3J 1P3 — In the light of recent experimental results of Jung et al \([1]\) we have extended our relativistic distorted wave (RDW) calculations \([2]\) to the electron impact excitation of the ten higher-lying fine-structure levels of the $3p^55p$ configuration of argon from the lowest metastable states (the $J = 0, 2$ levels of the $3p^54s$ configuration). We compare our theoretical results with their experimental results and discuss the differences from the similar excitation to the $3p^54p$ levels from the same metastable states \([2]\). \([1]\) R. O. Jung, J. B. Boffard, L; W; Anderson and C. C. Lin, Phys. Rev. A \textbf{75}, 052707 (2007). \([2]\) R. Srivastava, A. D. Stauffer and L. Sharma, Phys. Rev. A \textbf{74}, 012715 (2006).
