In our laboratory, the pulsed discharge plasmas have been used to treat exhaust gases. Since pulse duration of an applied voltage has a strong influence on an energy efficiency of a pollutant removal, the development of short pulse generator is of paramount importance for the practical applications. Recently, it is demonstrated by our research group that the non-thermal plasma produced using the 5 ns pulsed discharge has extremely higher energy efficiency to produce of ozone and abate nitric oxide. Typically, the yields of ozone generation are 550 g-\text{O}_3/\text{kWh} in oxygen and 250 g-\text{O}_3/\text{kWh} in dry air, and the energy efficiency of NO removal from the simulated exhaust gas having 200 ppm of NO in nitrogen is 24 g-\text{NO}/\text{kWh}. The efficiencies are the highest value in the literatures. In the presentation, the 5 ns pulsed discharge processing would be introduced.
