Nonperturbative electron-ion scattering theory incorporating the Møller interaction

CHRISTOPHER J. BOSTOCK, DMITRY V. FURSA, IGOR BRAY, Curtin University — Relativistic distorted wave studies by Fontes’s etal [Phys. Rev. A 47, 1009 (1993)] demonstrated that the Generalized Breit interaction (equivalently the Møller interaction) can affect electron-impact excitation cross sections of hydrogenlike U\textsuperscript{91+} by more that 50% in comparison to calculations that employ the Coulomb interaction alone. We present the first calculations that investigate the effects of both the Møller interaction and close-coupling in the calculation of electron-impact excitation cross sections [1]. Electron scattering from U\textsuperscript{91+} is used as a test case. The RCCC method is nonperturbative and we emphasise the restrictions and subsequent limitations associated with employing the Møller interaction in the RCCC method.
