Backbending phenomena in light nuclei at $A \sim 60$ mass region S. EL-KAMESSEY, Department of Physics and Astronomy, King Saud University, Saudi Arabia, H. ALHARBI, National Centre for Mathematics and Physics, KACST, Saudi Arabia, H ALHENDI, Department of Physics and Astronomy, King Saud University, Saudi Arabia — Recent studies of the backbending phenomena in medium light weight nuclei near $A \sim 60$ expanded greatly our interest about how the single particle orbits are nonlinearly affected by the collective motion. As a consequence we have applied a modified version of the exponential model with the inclusion of pairing correlation to describe the energy spectra of the ground state bands and/or the backbending phenomena in mass region at $A \sim 60$. A firm conclusion is obtained concerning the successful validity of the proposed modified model in describing the backbending phenomena in this region. Comparison with different theoretical descriptions is discussed.
