Search for Alpha particle Condensation in $^{16}$O

TOSHIYA TAKAHASHI, CYRIC, Tohoku University, MASATOSHI ITOH, HIDETOMO YOSHIDA, YASUHIRO SAKEMI, CYRIC, NAOYA SUGIMOTO, TETUYA NAGANO, AKIHITO OIKAWA, TOMOHIRO HAYAMIZU, CYRIC, Tohoku University — Recently, Tohsaki et al were proposed the $\alpha$ particles condensed state existed in the vicinity of the threshold energy that decay into 3- and 4-$\alpha$ particles in the $^{12}$C and $^{16}$O nuclei. The energy state of the 4-$\alpha$ particles condensation has not been specified yet in $^{16}$O though it is considered that the second $0^+$ state (7.65MeV) in $^{12}$C is the 3-$\alpha$ particles condensed one theoretically. To verify the existence of the $\alpha$ condensation in $^{16}$O, we have performed the experiment on the $^{12}$C($^{16}$O, $^{16}$O*[X+$\alpha$]) $^{12}$C reaction. The probability of the 4-$\alpha$ particles condensed state of $^{16}$O decays to 3-$\alpha$ condensed one of $^{12}$C and an $\alpha$ particle is large. Therefore, we investigate the excited state in $^{16}$O by obtaining the branching ratio of each decay channel of $^{16}$O$\rightarrow^{12}$C ($0^+_2$) + $\alpha$, $^{16}$O$\rightarrow^{12}$C (2$^+_1$) + $\alpha$, $^{16}$O$\rightarrow^{12}$C (g.s) + $\alpha$. In this talk, we will report on result of the experiment and the MonteCarlo simulation in $^{16}$O for excited state of 15.1MeV which was one of candidates for the 4-$\alpha$ condensation.
