Abstract Submitted for the MAR05 Meeting of The American Physical Society

Antiferromagnetism and charged vortices in high-Tc superconductors DANIEL KNAPP¹, McMaster University, CATHERINE KALLIN, Mc-Master University, AMIT GHOSAL, Duke University, SARAH MANSOUR, Mc-Master University — We present the results of a detailed mean-field study of the effect of the long-range Coulomb interaction on charge accumulation in antiferromagnetic vortices in high- T_c superconductors. We have found that antiferromagnetism is associated with an accumulation of charge in the vortex core, even in the presence of the long-range Coulomb interaction and that the local density of states in the vortex core, as described by a simple theory of competing dSC and AFM orders, is in excellent qualitative agreement with experimental data. We also touch on the manifestation of Π -triplet pairing in the presence of coexisting dSC and AFM order, and the intriguing appearance of one-dimensional stripe-like ordering.
